GOOD NEWS

On stormy, amow nights, when you are driving slowly, with your car's lights and heater on, your battery is bearing a terrific load. Sometimes it gives out under the strain. This is because it is generated by direct current. Soon there will be an alternating current generator available at low cost. It's said to be able to deliver almost a third more power and to be able to take care of all demands at low speeds.

Anhydrous Ammonia

Lethbridge Experimental Station
Weekly Letter
U. J. FRYMAN

Anhydrous ammonia has recently been introduced into Alberta as a fertilizer for direct application in field and vegetable crops. The following information will point out some of the advantages, as well as some of the advantages and disadvantages of using this new fertilizer material.

Anhydrous ammonia is a colorless, colorless liquid if kept under moderate pressure at ordinary temperatures. When the pressure is released, it becomes a gas consisting of about 82 per cent nitrogen and 18 per cent hydrogen. The gas is extremely pungent, and heavy concentrations of it are choking and blinding. Because of its sharp odor, there is usually sufficient warning to allow for escape from a danger area. The liquid, in contact with the skin, will cause severe burns. Anhydrous ammonia at 80° F. weighs approximately 6 pounds per cubic foot and will fill 100 pounds per square inch.

It must be stored and transported in special tanks and special pressure containers. Many types of machinery have been used successfully to apply this fertilizer directly to the soil. The soil has a pressure tank, a metering system to control the rate of application, and an applicator line. Some of the most efficient implements used as Anhydrous tanks are easily adapted to apply anhydrous ammonia in a broadcast treatment to corn, sorghum, and at the most desirable times for the crop.

The high nitrogen content of anhydrous ammonia helps to make it a desirable fertilizer material. Anhydrous ammonia is readily absorbed by the soil and this is greatest when the soil is moist. Under proper conditions, it is absorbed into the soil, where it is required for soil fertilizers, but the capital outlay for application equipment may be considerable.

When anhydrous ammonia is applied directly to the soil, it is usually applied by means of the tractor and the applicator is towed by the tractor. In some cases, some of the knowledge is required in soil application. Since only anhydrous ammonia is used, it is essential that the applicator be equipped with a pump or pump requiring additional power, such as a pump and pump.
